PREFACE

This Solutions Manual gives intermediate and final numerical results for all end-of-chapter Problems, Exercises, and Projects with computational elements contained in *Applied Linear Statistical Models*, 5th edition. This Solutions Manual also contains proofs for all Exercises that require derivations. No solutions are provided for the Case Studies.

In presenting calculational results we frequently show, for ease in checking, more digits than are significant for the original data. Students and other users may obtain slightly different answers than those presented here, because of different rounding procedures. When a problem requires a percentile (e.g. of the t or F distributions) not included in the Appendix B Tables, users may either interpolate in the table or employ an available computer program for finding the needed value. Again, slightly different values may be obtained than the ones shown here.

We have included many more Problems, Exercises, and Projects at the ends of chapters than can be used in a term, in order to provide choice and flexibility to instructors in assigning problem material. For all major topics, three or more problem settings are presented, and the instructor can select different ones from term to term. Another option is to supply students with a computer printout for one of the problem settings for study and class discussion and to select one or more of the other problem settings for individual computation and solution. By drawing on the basic numerical results in this Manual, the instructor also can easily design additional questions to supplement those given in the text for a given problem setting.

The data sets for all Problems, Exercises, Projects and Case Studies are contained in the compact disk provided with the text to facilitate data entry. It is expected that the student will use a computer or have access to computer output for all but the simplest data sets, where use of a basic calculator would be adequate. For most students, hands-on experience in obtaining the computations by computer will be an important part of the educational experience in the course.

While we have checked the solutions very carefully, it is possible that some errors are still present. We would be most grateful to have any errors called to our attention. Errata can be reported via the website for the book: http://www.mhhe.com/KutnerALSM5e. We acknowledge with thanks the assistance of Lexin Li and Yingwen Dong in the checking of Chapters 1-14 of this manual. We, of course, are responsible for any errors or omissions that remain.

1.31. No, no

1.32. Solving (1.9a) and (1.9b) for b_0 and equating the results:

$$\frac{\sum Y_i - b_1 \sum X_i}{n} = \frac{\sum X_i Y_i - b_1 \sum X_i^2}{\sum X_i}$$

and then solving for b_1 yields:

$$b_1 = \frac{n\sum X_iY_i - \sum X_i \sum Y_i}{n\sum X_i^2 - (\sum X_i)^2} = \frac{\sum X_iY_i - \dfrac{\sum X_i \sum Y_i}{n}}{\sum X_i^2 - \dfrac{(\sum X_i)^2}{n}}$$

1.33. $Q = \sum(Y_i - \beta_0)^2$

$$\frac{dQ}{d\beta_0} = -2\sum(Y_i - \beta_0)$$

Setting the derivative equal to zero, simplifying, and substituting the least squares estimator b_0 yields:

$\sum(Y_i - b_0) = 0$ or $b_0 = \bar{Y}$

1.34. $E\{b_0\} = E\{\bar{Y}\} = \dfrac{1}{n}\sum E\{Y_i\} = \dfrac{1}{n}\sum \beta_0 = \beta_0$

1.35. From the first normal equation (1.9a):

$$\sum Y_i = nb_0 + b_1 \sum X_i = \sum(b_0 + b_1X_i) = \sum \hat{Y}_i \text{ from (1.13)}$$

1.36. $\sum \hat{Y}_i e_i = \sum(b_0 + b_1X_i)e_i = b_0 \sum e_i + b_1 \sum X_i e_i = 0$ because $\sum e_i = 0$ from (1.17) and $\sum X_i e_i = 0$ from (1.19).

1.38. (1) 76, yes; (2) 60, yes

1.39. a. Applying (1.10a) and (1.10b) to $(5, \bar{Y}_1)$, $(10, \bar{Y}_2)$ and $(15, \bar{Y}_3)$, we obtain:

$$b_1 = \frac{\bar{Y}_3 - \bar{Y}_1}{10} \qquad b_0 = \frac{4\bar{Y}_1 + \bar{Y}_2 - 2\bar{Y}_3}{3}$$

Using (1.10a) and (1.10b) with the six original points yields the same results.

b. Yes

1.40. No

1.41. a. $Q = \sum(Y_i - \beta_1 X_i)^2$

$$\frac{dQ}{d\beta_1} = -2\sum(Y_i - \beta_1 X_i)X_i$$

Setting the derivative equal to zero, simplifying, and substituting the least squares estimator b_1 yields:

$$b_1 = \frac{\sum Y_i X_i}{\sum X_i^2}$$

b. $L = \prod_{i=1}^{n} \dfrac{1}{(2\pi\sigma^2)^{1/2}} \exp\left[-\dfrac{1}{2\sigma^2}(Y_i - \beta_1 X_i)^2\right]$

It is more convenient to work with $\log_e L$:

$$\begin{aligned}\log_e L &= -\frac{n}{2}\log_e(2\pi\sigma^2) - \frac{1}{2\sigma^2}\sum(Y_i - \beta_1 X_i)^2 \\ \frac{d\log_e L}{d\beta_1} &= \frac{1}{\sigma^2}\sum(Y_i - \beta_1 X_i)X_i\end{aligned}$$

Setting the derivative equal to zero, simplifying, and substituting the maximum likelihood estimator b_1 yields:

$\sum(Y_i - b_1 X_i)X_i = 0$ or $b_1 = \dfrac{\sum Y_i X_i}{\sum X_i^2}$

Yes

c. $E\{b_1\} = E\left\{\dfrac{\sum Y_i X_i}{\sum X_i^2}\right\} = \dfrac{1}{\sum X_i^2}\sum X_i E\{Y_i\}$

$= \dfrac{1}{\sum X_i^2}\sum X_i(\beta_1 X_i) = \beta_1$

1.42. a. $L(\beta_1) = \prod_{i=1}^{6}\dfrac{1}{\sqrt{32\pi}}\exp[-\dfrac{1}{32}(Y_i - \beta_1 X_i)^2]$

b. $L(17) = 9.45 \times 10^{-30}$, $L(18) = 2.65 \times 10^{-7}$, $L(19) = 3.05 \times 10^{-37}$

b. Maximum likelihood estimators can be found more easily by working with $\log_e L$:

$$\log_e L = -\frac{n}{2}\log_e(2\pi\sigma^2) - \frac{1}{2\sigma^2}\sum(Y_i - \beta_0 - \beta_1 X_i)^2 + \sum \log_e g(X_i)$$

Setting each derivative equal to zero, simplifying, and substituting the maximum likelihood estimators b_0, b_1, and $\hat{\sigma}^2$ yields:

(1) $\sum Y_i - nb_0 - b_1 \sum X_i = 0$

(2) $\sum Y_i X_i - b_0 \sum X_i - b_1 \sum X_i^2 = 0$

(3) $\dfrac{\sum(Y_i - b_0 - b_1 X_i)^2}{n} = \hat{\sigma}^2$

Setting the derivatives equal to zero, simplifying, and substituting the maximum likelihood estimators $\hat{\mu}_1$, $\hat{\mu}_2$, $\hat{\sigma}_1$, $\hat{\sigma}_2$, and $\hat{\rho}_{12}$ yields:

$$(1)\quad \frac{1}{\hat{\sigma}_1}\sum(Y_{i1}-\hat{\mu}_1) - \frac{\hat{\rho}_{12}}{\hat{\sigma}_2}\sum(Y_{i2}-\hat{\mu}_2) = 0$$
$$(2)\quad \frac{1}{\hat{\sigma}_2}\sum(Y_{i2}-\hat{\mu}_2) - \frac{\hat{\rho}_{12}}{\hat{\sigma}_1}\sum(Y_{i1}-\hat{\mu}_1) = 0$$
$$(3)\quad \frac{\sum(Y_{i1}-\hat{\mu}_1)^2}{\hat{\sigma}_1^2} - \hat{\rho}_{12}\frac{\sum(Y_{i1}-\hat{\mu}_1)(Y_{i2}-\hat{\mu}_2)}{\hat{\sigma}_1\hat{\sigma}_2} - n(1-\hat{\rho}_{12}^2) = 0$$
$$(4)\quad \frac{\sum(Y_{i2}-\hat{\mu}_2)^2}{\hat{\sigma}_2^2} - \hat{\rho}_{12}\frac{\sum(Y_{i1}-\hat{\mu}_1)(Y_{i2}-\hat{\mu}_2)}{\hat{\sigma}_1\hat{\sigma}_2} - n(1-\hat{\rho}_{12}^2) = 0$$
$$(5)\quad n\hat{\rho}_{12}(1-\hat{\rho}_{12}^2) + (1+\hat{\rho}_{12}^2)\sum\left(\frac{Y_{i1}-\hat{\mu}_1}{\hat{\sigma}_1}\right)\left(\frac{Y_{i2}-\hat{\mu}_2}{\hat{\sigma}_2}\right)$$

Solving equations (1) and (2) yields:

$$\hat{\mu}_1 = \bar{Y}_1 \qquad \hat{\mu}_2 = \bar{Y}_2$$

Using these results in equations (3), (4), and (5), it will be found that the maximum likelihood estimators are:

$$\hat{\mu}_1 = \bar{Y}_1 \qquad \hat{\mu}_2 = \bar{Y}_2 \qquad \hat{\sigma}_1 = \sqrt{\frac{\sum(Y_{i1}-\bar{Y}_1)^2}{n}}$$

c. The equivalence is shown by letting Y_{i1} and Y_{i2} in part (b) be Y_i and X_i, respectively.

2.60. Using regression notation and letting

$$\sum(X_i - \bar{X})^2 = (n-1)s_X^2$$

and

$$\sum(Y_i - \bar{Y})^2 = (n-1)s_Y^2,$$

we have from (2.84) with $Y_{i1} = Y_i$ and $Y_{i2} = X_i$

$$b_1 = r_{12} \frac{s_Y}{s_X} \text{ since } b_1 = \left[\frac{\sum(Y_i - \bar{Y})^2}{\sum(X_i - \bar{X})^2} \right]^{\frac{1}{2}} r_{12}$$

c. Yes

d. No, no

e. No, yes, $Y_i' = \log_e(Y_i^{-1} - 1) = \beta_0 + \beta_1 X_{i1} + \varepsilon_i$

6.23. a. $Q = \sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})^2$

$$\frac{\partial Q}{\partial \beta_1} = -2\sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})X_{i1}$$

$$\frac{\partial Q}{\partial \beta_2} = -2\sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})X_{i2}$$

Setting the derivatives equal to zero, simplifying, and substituting the least squares estimators b_1 and b_2 yields:

$$\sum Y_i X_{i1} - b_1 \sum X_{i1}^2 - b_2 \sum X_{i1} X_{i2} = 0$$

$$\sum Y_i X_{i2} - b_1 \sum X_{i1} X_{i2} - b_2 \sum X_{i2}^2 = 0$$

and:

$$b_1 = \frac{\sum Y_i X_{i2} \sum X_{i1} X_{i2} - \sum Y_i X_{i1} \sum X_{i2}^2}{(\sum X_{i1} X_{i2})^2 - \sum X_{i1}^2 \sum X_{i2}^2}$$

$$b_2 = \frac{\sum Y_i X_{i1} \sum X_{i1} X_{i2} - \sum Y_i X_{i2} \sum X_{i1}^2}{(\sum X_{i1} X_{i2})^2 - \sum X_{i1}^2 \sum X_{i2}^2}$$

b. $L = \prod_{i=1}^{n} \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left[-\frac{1}{2\sigma^2}(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})^2\right]$

It is more convenient to work with $\log_e L$:

$$\log_e L = -\frac{n}{2}\log_e(2\pi\sigma^2) - \frac{1}{2\sigma^2}\sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})^2$$

$$\frac{\partial \log_e L}{\partial \beta_1} = \frac{1}{\sigma^2}\sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})X_{i1}$$

$$\frac{\partial \log_e L}{\partial \beta_2} = \frac{1}{\sigma^2}\sum(Y_i - \beta_1 X_{i1} - \beta_2 X_{i2})X_{i2}$$

Setting the derivatives equal to zero, simplifying, and substituting the maximum likelihood estimators b_1 and b_2 yields the same normal equations as in part (a), and hence the same estimators.

6.24. a. $Q = \sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})^2$

$$\frac{\partial Q}{\partial \beta_0} = -2\sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})$$

$$\frac{\partial Q}{\partial \beta_1} = -2\sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})X_{i1}$$

$$\frac{\partial Q}{\partial \beta_2} = -2\sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})X_{i1}^2$$

$$\frac{\partial Q}{\partial \beta_3} = -2\sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})X_{i2}$$

Setting the derivatives equal to zero, simplifying, and substituting the least squares estimators b_0, b_1, b_2, and b_3 yields the normal equations:

$\sum Y_i - nb_0 - b_1 \sum X_{i1} - b_2 \sum X_{i1}^2 - b_3 \sum X_{i2} = 0$

$\sum Y_i X_{i1} - b_0 \sum X_{i1} - b_1 \sum X_{i1}^2 - b_2 \sum X_{i1}^3 - b_3 \sum X_{i1} X_{i2} = 0$

$\sum Y_i X_{i1}^2 - b_0 \sum X_{i1}^2 - b_1 \sum X_{i1}^3 - b_2 \sum X_{i1}^4 - b_3 \sum X_{i1}^2 X_{i2} = 0$

$\sum Y_i X_{i2} - b_0 \sum X_{i2} - b_1 \sum X_{i1} X_{i2} - b_2 \sum X_{i1}^2 X_{i2} - b_3 \sum X_{i2}^2 = 0$

b. $L = \prod_{i=1}^{n} \frac{1}{\sqrt{2\pi\sigma^2}} \exp[-\frac{1}{2\sigma^2}(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})^2]$

or

$\log_e L = -\frac{n}{2}\log_e(2\pi\sigma^2) - \frac{1}{2\sigma^2}\sum(Y_i - \beta_0 - \beta_1 X_{i1} - \beta_2 X_{i1}^2 - \beta_3 X_{i2})^2$

6.25. Fit $Y_i' = \beta_0 + \beta_1 X_{i1} + \beta_3 X_{i3} + \varepsilon_i$, where $Y_i' = Y_i - 4X_{i2}$

6.26. For regression model (6.1), $R^2 = 1 - \frac{SSE(X_1, X_2)}{SSTO}$

When regressing Y_i on $\hat{Y}_i$, $SSTO$ remains unchanged and the fitted regression equation:

$$\hat{Y}_i^* = b_0^* + b_1^* \hat{Y}_i$$

has coefficients $b_0^* = 0$, $b_1^* = 1$ because:

$$\begin{aligned} b_1^* &= \frac{\sum(\hat{Y}_i - \bar{Y})(Y_i - \bar{Y})}{\sum(\hat{Y}_i - \bar{Y})^2} = \frac{\sum(\hat{Y}_i - \bar{Y})[(Y_i - \hat{Y}_i) + (\hat{Y}_i - \bar{Y})]}{\sum(\hat{Y}_i - \bar{Y})^2} \\ &= \frac{\sum(\hat{Y}_i - \bar{Y})[e_i + (\hat{Y}_i - \bar{Y})]}{\sum(\hat{Y}_i - \bar{Y})^2} = 1 \end{aligned}$$

since $\sum e_i \hat{Y}_i = 0$ and $\sum e_i \bar{Y} = 0$ by (1.20) and (1.17).

$$b_0^* = \bar{Y} - b_1^* \bar{Y} = 0$$

Hence $\hat{Y}_i^* = \hat{Y}_i$ and $SSE(\hat{Y}) = \sum(Y_i - \hat{Y}_i^*)^2 = \sum(Y_i - \hat{Y}_i)^2 = SSE(X_1, X_2)$, and:

$$r^2 = 1 - \frac{SSE(\hat{Y})}{SSTO} = 1 - \frac{SSE(X_1, X_2)}{SSTO} = R^2$$

(5) $Y_i = \beta_0 + \beta_c(X_{i1} + X_{i2}) + \beta_3 X_{i1}^2 + \varepsilon_i$, where $\beta_c = \beta_1 = \beta_2$

7.33. *Let*: $y_i = Y_i - \bar{Y}$

$$x_{i1} = X_{i1} - \bar{X}_1$$
$$x_{i2} = X_{i2} - \bar{X}_2$$

Then: $SSR(X_1) = \dfrac{(\sum x_{i1} y_i)^2}{\sum x_{i1}^2} = \sum y_i^2 r_{Y1}^2$ by (1.10a), (2.51) and (2.84)

$$SSE(X_1) = \sum y_i^2 - \frac{(\sum x_{i1} y_i)^2}{\sum x_{i1}^2} = \sum y_i^2(1 - r_{Y1}^2)$$

$SSR(X_1, X_2) = b_1 \sum x_{i1} y_i + b_2 \sum x_{i2} y_i$ by (2.43) and $\sum y_i = 0$

Further:

$$b_1 = \frac{\dfrac{\sum x_{i1} y_i}{\sum x_{i1}^2} - \left[\dfrac{\sum y_i^2}{\sum x_{i1}^2}\right]^{1/2} r_{Y2} r_{12}}{1 - r_{12}^2} \quad \text{by (7.56)}$$

and similarly:

$$b_2 = \frac{\dfrac{\sum x_{i2}y_i}{\sum x_{i2}^2} - \left[\dfrac{\sum y_i^2}{\sum x_{i2}^2}\right]^{1/2} r_{Y1}r_{12}}{1 - r_{12}^2}$$

Substituting these expressions for b_1 and b_2 into $SSR(X_1,\, X_2)$, we obtain after some simplification:

$$SSR(X_1,\, X_2) = \frac{1}{1 - r_{12}^2}\left[\sum y_i^2 r_{Y1}^2 + \sum y_i^2 r_{Y2}^2 - 2\sum y_i^2 r_{Y1}r_{Y2}r_{12}\right]$$

Now by (7.36) and (7.2b), we have:

$$r_{Y2|1}^2 = \frac{SSR(X_1,\, X_2) - SSR(X_1)}{SSE(X_1)}$$

Substituting the earlier expressions into the above, we obtain after some simplifying:

$$r_{Y2|1}^2 = \frac{1}{\sum y_i^2(1 - r_{Y1}^2)(1 - r_{12}^2)}[\sum y_i^2 r_{Y1}^2 + \sum y_i^2 r_{Y2}^2 - 2\sum y_i^2 r_{Y1}r_{Y2}r_{12}$$
$$- (1 - r_{12}^2)\sum y_i^2 r_{Y1}^2]$$

After some further simplifying, we obtain:

$$r_{Y2|1}^2 = \frac{(r_{Y2} - r_{12}r_{Y1})^2}{(1 - r_{Y1}^2)(1 - r_{12}^2)}$$

7.34. a. (1) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ (2) $\begin{bmatrix} .7420 \\ .6385 \end{bmatrix}$

(3) $\begin{bmatrix} .7420 \\ .6385 \end{bmatrix}$ (4) $\begin{bmatrix} .0083 & 0 \\ 0 & .0083 \end{bmatrix}$

b. From (7.53), $b_1^* = \dfrac{1.069}{7.745}(5.375) = .742$

$$b_2^* = \frac{.5345}{7.745}(9.250) = .638$$

7.35. From (7.45), we have:

$$Y_i^* = \beta_1^* X_{i1}^* + \beta_2^* X_{i2}^* + \varepsilon_i^*$$

$$\frac{1}{\sqrt{n-1}}\left(\frac{Y_i - \bar{Y}}{s_Y}\right) = \beta_1^* \frac{1}{\sqrt{n-1}}\left(\frac{X_{i1} - \bar{X}_1}{s_1}\right) + \beta_2^* \frac{1}{\sqrt{n-1}}\left(\frac{X_{i2} - \bar{X}_2}{s_2}\right) + \varepsilon_i^*$$

Simplifying, we obtain:

$$Y_i = (\bar{Y} - \beta_1^* \frac{s_Y}{s_1}\bar{X}_1 - \beta_2^* \frac{s_Y}{s_2}\bar{X}_2) + \beta_1^* \frac{s_Y}{s_1}X_{i1} + \beta_2^* \frac{s_Y}{s_2}X_{i2} + \sqrt{n-1}\, s_Y \varepsilon_i^*$$

Hence:

$$\beta_1^* \frac{s_Y}{s_1} = \beta_1 \qquad \beta_2^* \frac{s_Y}{s_2} = \beta_2$$

7.36. $\mathbf{X}^*\mathbf{Y} = \begin{bmatrix} \Sigma X_{i1}^* Y_i^* \\ \Sigma X_{i2}^* Y_i^* \end{bmatrix} = \begin{bmatrix} \dfrac{\Sigma(X_{i1} - \bar{X}_1)(Y_i - \bar{Y})}{(n-1)s_1 s_Y} \\ \dfrac{\Sigma(X_{i2} - \bar{X}_2)(Y_i - \bar{Y})}{(n-1)s_2 s_Y} \end{bmatrix} = \begin{bmatrix} r_{Y1} \\ r_{Y2} \end{bmatrix}$

12.24. $Y_t' = Y_t - \rho Y_{t-1}$

$$= \beta_0 + \beta_1 X_{t1} + \beta_2 X_{t2} + \varepsilon_t - \rho(\beta_0 + \beta_1 X_{t-1,1} + \beta_2 X_{t-1,2} + \varepsilon_{t-1})$$

Since $\varepsilon_t - \rho\varepsilon_{t-1} = u_t$, we have:

$$Y_t' = \beta_0' + \beta_1' X_{t1}' + \beta_2' X_{t2}' + u_t$$

where $\beta_0' = \beta_0(1-\rho)$, $\beta_1' = \beta_1$, $\beta_2' = \beta_2$, $X_{t1}' = X_{t1} - \rho X_{t-1,1}$, and

$X_{t2}' = X_{t2} - \rho X_{t-1,2}$

12.25. a. $Y_t' = Y_t - \rho_1 Y_{t-1} - \rho_2 Y_{t-2}$

$X_t' = X_t - \rho_1 X_{t-1} - \rho_2 X_{t-2}$

b. By regressing the residuals e_t against the two independent variables e_{t-1} and e_{t-2} with no intercept term in the regression model and obtaining the two regression coefficients. The answer to Exercise 6.23a provides the explicit formulas, with Y, X_1, and X_2 replaced by e_t, e_{t-1}, and e_{t-2}, respectively.

c. By minimizing $SSE = \sum(Y_t' - b_0' - b_1' X_t')^2$ with respect to ρ_1 and ρ_2.

12.26. $Y_{n+1} = \beta_0 + \beta_1 X_{n+1} + \rho_1\varepsilon_n + \rho_2\varepsilon_{n-1} + u_{n+1}$

since $\varepsilon_{n+1} = \rho_1\varepsilon_n + \rho_2\varepsilon_{n-1} + u_{n+1}$. Therefore:

$$F_{n+1} = \hat{Y}_{n+1} + r_1 e_n + r_2 e_{n-1}$$

where r_1 and r_2 are point estimates of ρ_1 and ρ_2, respectively, obtained by either the Cochrane-Orcutt procedure or the Hildreth-Lu procedure.

$$\frac{\partial Q}{\partial \gamma_2} = -2\sum[Y_i - \gamma_0 - \gamma_2 \exp(-\gamma_1 X_i)][\exp(-\gamma_1 X_i)]$$

Setting each derivative equal to zero, simplifying, and substituting the least squares estimators g_0, g_1, and g_2 yields:

$\sum Y_i - ng_0 - g_2 \sum exp(-g_1 X_i) = 0$

$g_2 \sum Y_i X_i \exp(-g_1 X_i) - g_0 g_2 \sum X_i \exp(-g_1 X_i) - g_2^2 \sum X_i \exp(-2g_1 X_i) = 0$

$\sum Y_i \exp(-g_1 X_i) - g_0 \sum exp(-g_1 X_i) - g_2 \sum exp(-2g_1 X_i) = 0$

Setting the derivatives equal to zero, simplifying, and substituting the least squares estimators g_0 and g_1 yields:

$$\sum \frac{Y_i X_i}{g_1 + X_i} - g_0 \sum \left(\frac{X_i}{g_1 + X_i} \right)^2 = 0$$

$$g_0 \sum \frac{Y_i X_i}{(g_1 + X_i)^2} - g_0^2 \sum \left[\frac{X_i^2}{(g_1 + X_i)^3} \right] = 0$$

Setting the derivatives equal to zero, simplifying, and substituting the least squares estimators g_0, g_1, and g_2 yields:

$$\sum Y_i X_{i1}^{g_1} X_{i2}^{g_2} - g_0 \sum X_{i1}^{2g_1} X_{i2}^{2g_2} = 0$$

$$g_0 \sum Y_i X_{i1}^{g_1} X_{i2}^{g_2} \log_e X_{i1} - g_0^2 \sum X_{i1}^{2g_1} X_{i2}^{2g_2} \log_e X_{i1} = 0$$

13.24. a. $E\{Y\} = E \left\{ \gamma_0 - \dfrac{\gamma_0}{1 + (X/\gamma_2)^{\gamma_1}} + \varepsilon \right\}$

$$= \gamma_0 - \frac{\gamma_0}{1 + (X/\gamma_2)^{\gamma_1}} = \gamma_0 \left[\frac{(X/\gamma_2)^{\gamma_1}}{1 + (X/\gamma_2)^{\gamma_1}} \right] = \gamma_0 \left(\frac{A}{1 + A} \right)$$

since $(X/\gamma_2)^{\gamma_1} = \exp[\gamma_1(\log_e X - \log_e \gamma_2)]$.

b. $E\{Y'\} = (1/\gamma_0) E\{Y'\} = A/(1 + A)$; hence:

$$\frac{E\{Y'\}}{1 - E\{Y'\}} = \frac{\dfrac{A}{1 + A}}{1 - \dfrac{A}{1 + A}} = A = \exp(\beta_0 + \beta_1 X')$$

c. $\log_e \left(\dfrac{Y'}{1 - Y'} \right) = \log_e \left(\dfrac{Y}{\gamma_0 - Y} \right)$, $X' = \log_e X$

d. Since $\beta_0 = -\gamma_1 \log_e \gamma_2$ or $\gamma_2 = \exp(-\beta_0/\gamma_1)$ and $\gamma_1 = \beta_1$, starting values are $g_1^{(0)} = b_1$ and $g_2^{(0)} = \exp\left(-b_0/g_1^{(0)}\right)$.

$$= [1 + \exp(-\beta_0 - \beta_1 X)]^{-1}$$

14.41. Formula (14.26) holds for given observations Y_1, Y_2,... Y_n. Assembling all terms with a given X value, X_j, we obtain:

$$y_{.j}(\beta_0 + \beta_1 X_j) - n_j \log_e[1 + \exp(\beta_0 + \beta_1 X_j)]$$

since there are n_j cases with X value X_j, of which $y_{.j}$ have value $Y_i = 1$. There are $\binom{n_j}{y_{.j}}$ ways of obtaining these $y_{.j}$ 1s out of n_j, all of which are equally likely. Hence, in the log-likelihood function of the $y_{.j}$, we must add $\log_e \binom{n_j}{y_{.j}}$ to the above term for given X_j :

$$\log_e \binom{n_j}{y_{.j}} + y_{.j}(\beta_0 + \beta_1 X_j) - n_j \log_e [1 + \exp(\beta_0 + \beta_1 X_j)]$$

Assembling the terms for all X_j, we obtain (14.34).

14.42. From (14.16) and (14.18), we have:

$$\pi_i = \frac{\exp(\pi')}{1+\exp(\pi')}$$

Then:

$$1-\pi = \frac{1+\exp(\pi') - \exp(\pi')}{1+\exp(\pi')} = [1+\exp(\pi')]^{-1}$$

$$\frac{\pi}{1-\pi} = \frac{\exp(\pi')}{1+\exp(\pi')} \times [1+\exp(\pi')] = \exp(\pi')$$

Solving for $\pi' = F_L^{-1}(\pi)$ by taking logarithms of both sides yields the result.

14.43. From (14.26), we obtain:

$$\frac{\partial^2 \log_e L}{\partial \beta_0^2} = -\sum_{i=1}^{n} \frac{\exp(\beta_0 + \beta_1 X_i)}{[(1+\exp(\beta_0 + \beta_1 X_i)]^2}$$

$$\frac{\partial^2 \log_e L}{\partial \beta_1^2} = -\sum_{i=1}^{n} \frac{X_i^2 \exp(\beta_0 + \beta_1 X_i)}{[1+\exp(\beta_0 + \beta_1 X_i)]^2}$$

$$\frac{\partial^2 \log_e L}{\partial \beta_0 \partial \beta_1} = -\sum_{i=1}^{n} \frac{X_i \exp(\beta_0 + \beta_1 X_i)}{[1+\exp(\beta_0 + \beta_1 X_i)]^2}$$

Since these partial derivatives only involve the constants X_i, β_0, and β_1, the expectations of the partial derivatives are the partial derivatives themselves. Hence:

$$-E\left\{\frac{\partial^2 \log_e L}{\partial \beta_0^2}\right\} = -g_{00} \qquad -E\left\{\frac{\partial^2 \log_e L}{\partial \beta_0 \partial \beta_1}\right\} = -g_{01} = -g_{10}$$

$$-E\left\{\frac{\partial^2 \log_e L}{\partial \beta_1^2}\right\} = -g_{11}$$

and the stated matrix reduces to (14.51).

14.44.
$$\begin{bmatrix} 4.1762385 & 74.574657 \\ 74.574657 & 1{,}568.4817 \end{bmatrix}^{-1} = \begin{bmatrix} 1.58597 & -.075406 \\ -.075406 & .0042228 \end{bmatrix}$$

14.45. $E\{Y\} = \dfrac{\gamma_0}{1+\gamma_1 \exp(\gamma_2 X)}$

Consider $\gamma_2 < 0$ and $\gamma_1 > 0$; as $X \to \infty$, $E\{Y\} = \pi \to 1$ so that

$$1 = \lim_{X\to\infty} \left[\frac{\gamma_0}{1+\gamma_1 \exp(\gamma_2 X)}\right] = \gamma_0$$

Therefore, letting $\gamma_2 = -\beta_1$ and $\gamma_1 = \exp(-\beta_0)$ we have:

$$E\{Y\} = \frac{1}{1+\exp(-\beta_0 - \beta_1 X)} = \frac{\exp(\beta_0 + \beta_1 X)}{1+\exp(\beta_0 + \beta_1 X)}$$

14.46. $E\{Y\} = [1+\exp(-\beta_0 - \beta_1 X_1 - \beta_2 X_2 - \beta_3 X_1 X_2)]^{-1}$

$\pi'(X_1 + 1) = \beta_0 + \beta_1(X_1+1) + \beta_2 X_2 + \beta_3(X_1+1)X_2$

$\pi'(X_1) = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_1 X_2$

$\pi'(X_1 + 1) - \pi'(X_1) = \log_e(\text{odds ratio}) = \beta_1 + \beta_3 X_2$

Hence the odds ratio for X_1 is $\exp(\beta_1 + \beta_3 X_2)$. No.

14.47. $1 - \pi_i = \exp\left[-\exp\left(\dfrac{X_i - \gamma_0}{\gamma_1}\right)\right]$

$-\log_e(1 - \pi_i) = \exp\left(\dfrac{X_i - \gamma_0}{\gamma_1}\right)$

Hence: $\log_e[-\log_e(1 - \pi_i)] = \dfrac{X_i - \gamma_0}{\gamma_1} = -\dfrac{\gamma_0}{\gamma_1} + \dfrac{1}{\gamma_1}X_i = \beta_0 + \beta_1 X_i$

where $\beta_0 = -\dfrac{\gamma_0}{\gamma_1}$ and $\beta_1 = \dfrac{1}{\gamma_1}$.

b. Factor: questionnaire, with 3 levels (A, B, C).

c. Repeated measure design.

d. Subject-time combination (i.e., the different occasions when a treatment is applied to a subject).

15.17. a. Observational.

b. Factor 1: batch, with 5 levels.

Factor 2: barrel, with 4 levels (nested within batch).

c. Nested design.

d. Barrel.

15.18. a. Experimental.

b. Factor 1: poly-film thickness, with 2 levels (low, high).

Factor 2: old mixture ratio, with 2 levels (low, high).

Factor 3: operator glove type, with 2 levels (cotton, nylon).

Factor 4: underside oil coating, with 2 levels (no coating, coating).

c. Fractional factorial design.

d. 1000 moldings in a batch.

15.19. a. Randomized complete block design with four blocks and three treatments.

c. Assembler.

15.20. a. 2^3 factorial design with two replicates.

c. Rod.

15.23. a. H_0: $\bar{W} = 0$, H_a: $\bar{W} \neq 0$. $t^* = -.1915/.0112 = -17.10$, $t(.975, 19) = 2.093$. If $|t^*| > 2.093$ conclude H_0, otherwise conclude H_a. Conclude H_a. P-value = 0+.

Agree with results on page 670. They should agree.

b. H_0: $\beta_2 = \cdots = \beta_{20} = 0$, H_a: not all β_k $(k = 2, 3, \ldots, 20)$ equal zero. $F^* = [(.23586 - .023828)/(38 - 19)] \div [.023828/19] = 8.90$, $F(.95; 19, 19) = 2.17$. If $F^* > 2.17$ conclude H_0, otherwise conclude H_a. Conclude H_a. P-value = 0+.

Not of primary interest because blocking factor was used here to increase the precision.

15.24. Since $\bar{X} = \frac{n/2}{n} = 1/2$, it follows from the definition of X_i that:

$\sum(X_i - \bar{X}) = n/2(1 - 1/2)^2 + n/2(0 - 1/2)^2 = n/4$.

Then from (15.5a): $\sigma^2\{b_1\} = 4\sigma^2/n$.

$$\log_e L = -3\ \log_e 2\pi - 3\ \log_e\sigma^2 - \frac{1}{2\sigma^2}\sum\sum(Y_{ij}-\mu_i)^2$$

$$\frac{\partial(\log_e L)}{\partial\mu_i} = -\frac{2}{2\sigma^2}\sum_j(Y_{ij}-\mu_i)(-1)$$

Setting the partial derivatives equal to zero, simplifying, and substituting the maximum likelihood estimators yields:

$$\sum_j(Y_{ij}-\hat{\mu}_i) = 0$$

Therefore to show $(t^*)^2 = F^*$, it suffices to show:

d. $H_0: \beta_{11} = 0$, $H_a: \beta_{11} \neq 0$. $s\{b_{11}\} = .00525$, $t^* = .01016/.00525 = 1.935, t(.995; 117) = 2.619$. If $|t^*| \leq 2.619$ conclude H_0, otherwise H_a. Conclude H_0.

17.30. With $r = 2$ and $n_i \equiv n$, $MSE = s^2$ as defined in (A.63) and

$\max(\bar{Y}_{i.} - \mu_i) - \min(\bar{Y}_{i.} - \mu_i) = (\bar{Y}_{i.} - \mu_i) - (\bar{Y}_{i'.} - \mu_{i'}) =$

$= (\bar{Y}_{i.} - \bar{Y}_{i'.}) - (\mu_i - \mu_{i'}),\ i \neq i'.$

Thus:

$$q^* = \frac{(\bar{Y}_{i.} - \bar{Y}_{i'.}) - (\mu_i - \mu_{i'})}{s/\sqrt{n}} = \sqrt{2}|t^*|$$

17.31. Working within the probability expression, we obtain:

$$\left| \frac{(\bar{Y}_{i.} - \mu_i) - (\bar{Y}_{i'.} - \mu_{i'})}{\sqrt{MSE/n}} \right| \leq q(1-\alpha; r, n_T - r) \quad \text{or}$$

$$|(\bar{Y}_{i.} - \mu_i) - (\bar{Y}_{i'.} - \mu_{i'})| \leq \left(\sqrt{MSE/n}\right) q(1-\alpha; r, n_T - r) \quad \text{or}$$

$$|(\bar{Y}_{i.} - \mu_i) - (\bar{Y}_{i'.} - \mu_{i'})| \leq s\{\hat{D}\}T$$

since $T = \frac{1}{\sqrt{2}} q(1-\alpha; r, n_T - r)$ and $\sqrt{\frac{MSE}{n}} = \frac{s\{\hat{D}\}}{\sqrt{2}}$ or

$$-s\{\hat{D}\}T \leq (\bar{Y}_{i.} - \bar{Y}_{i'.}) - (\mu_i - \mu_{i'}) \leq s\{\hat{D}\}T \quad \text{or}$$

$$(\bar{Y}_{i.} - \bar{Y}_{i'.}) - Ts\{\hat{D}\} \leq \mu_i - \mu_{i'} \leq (\bar{Y}_{i.} - \bar{Y}_{i'.}) + Ts\{\hat{D}\}$$

17.32. When $r = 2$, $S^2 = F(1-\alpha;\ 1,\ n_T - 2)$ which by (A.50b) equals $[t(1-\alpha/2; n_T - 2)]^2$.

17.33.

$$\begin{aligned}
\sigma^2\{\hat{L}_i\} &= \sigma^2\{\bar{Y}_{i.} - \sum_{h=1}^{r} \bar{Y}_{h.}/r\} \\
&= \sigma^2\{\bar{Y}_{i.}\} + \sigma^2\{\sum \bar{Y}_{h.}/r\} - 2\sigma\{\bar{Y}_{i.}, \sum \bar{Y}_{h.}/r\} \\
&= \frac{\sigma^2}{n_i} + \frac{1}{r^2}\sum(\sigma^2/n_h) - \frac{2\sigma^2}{rn_i} \\
&= \frac{1}{r^2}\sigma^2 \sum_{h \neq i}^{r}(1/n_h) + \frac{\sigma^2}{n_i} + \frac{\sigma^2}{r^2 n_i} - \frac{2\sigma^2}{rn_i} \\
&= \frac{1}{r^2}\sigma^2 \sum_{h \neq i}^{r}(1/n_h) + \frac{\sigma^2}{n_i}\left(1 + \frac{1}{r^2} - \frac{2}{r}\right) \\
&= \frac{1}{r^2}\sigma^2 \sum_{h \neq i}^{r}(1/n_h) + \frac{\sigma^2}{n_i}\left(\frac{r-1}{r}\right)^2
\end{aligned}$$

Replacing σ^2 by the estimator MSE leads to (17.49).

17.34. Given $n_1 = n_3 = n$ and $n_2 = kn$. Let $c = kn/n_T$. Then $n_1 = n_3 = (n_T - kn)/2 = n_T(1-c)/2$ and $n_2 = cn_T$. Hence:

$$\sigma^2\{\bar{Y}_{1.} - \bar{Y}_{2.}\} = \sigma^2\{\bar{Y}_{3.} - \bar{Y}_{2.}\} = \sigma^2\left[\frac{2}{n_T(1-c)} + \frac{1}{cn_T}\right]$$

Differentiating with respect to c yields:

$$\frac{2\sigma^2}{n_T}(1-c)^{-2} + \frac{\sigma^2}{n_T}(-c^{-2})$$

Setting the derivative equal to zero and solving yields $c = .4142$.

Hence, $n_2 = (.4142)n_T$ and $n_1 = n_3 = (.2929)n_T$.

(Note: This derivation treats n as a continuous variable. Since n_2 must be an even integer, appropriate rounding of the calculated sample sizes is required. For example, if $n_T = 100$, the calculated sample sizes are $n_1 = 29.29$, $n_2 = 41.42$, and $n_3 = 29.29$. The smallest variance is obtained for $n_1 = 29$, $n_2 = 42$, and $n_3 = 29$.)

$$Q = \sum\sum\sum(Y_{ijk} - \mu_{ij})^2$$

$$\frac{\partial Q}{\partial\mu_{ij}} = 2\sum_k(Y_{ijk} - \mu_{ij})(-1)$$

Setting the derivatives equal to zero, simplifying, and solving for the least squares estimators yields:

$$\hat{\mu}_{ij} = \frac{\sum_k Y_{ijk}}{n} = \bar{Y}_{ij.}$$

19.47. $\sum\sum\sum(\bar{Y}_{ij.} - \bar{Y}_{...})^2 = \sum\sum\sum[(\bar{Y}_{i..} - \bar{Y}_{...}) + (\bar{Y}_{.j.} - \bar{Y}_{...}) + (\bar{Y}_{ij.} - \bar{Y}_{i..} - \bar{Y}_{.j.} + \bar{Y}_{...})]^2$

$$= \sum\sum\sum[(\bar{Y}_{i..} - \bar{Y}_{...})^2 + (\bar{Y}_{.j.} - \bar{Y}_{...})^2 + (\bar{Y}_{ij.} - \bar{Y}_{i..} - \bar{Y}_{.j.} + \bar{Y}_{...})^2$$
$$+2(\bar{Y}_{i..} - \bar{Y}_{...})(\bar{Y}_{.j.} - \bar{Y}_{...}) + 2(\bar{Y}_{i..} - \bar{Y}_{...})(\bar{Y}_{ij.} - \bar{Y}_{i..} - \bar{Y}_{.j.} + \bar{Y}_{...})$$
$$+2(\bar{Y}_{.j.} - \bar{Y}_{...})(\bar{Y}_{ij.} - \bar{Y}_{i..} - \bar{Y}_{.j.} + \bar{Y}_{...})]$$

since all summations of cross-product terms equal zero.

19.48. $E\{\hat{L}\} = E\{\sum c_j \bar{Y}_{.j.}\} = \sum c_j E\{\bar{Y}_{.j.}\} = \sum c_j \mu_{.j} = L$

$\sigma^2\{\hat{L}\} = \sigma^2\{\sum c_j \bar{Y}_{.j.}\} = \sum c_j^2 \sigma^2\{\bar{Y}_{.j.}\}$ because of independence

$$= \sum c_j^2 \frac{\sigma^2}{an} = \frac{\sigma^2}{an}\sum c_j^2$$

19.49. $\sigma^2\{\sum\sum c_{ij}\bar{Y}_{ij.}\} = \sum\sum c_{ij}^2 \sigma^2\{\bar{Y}_{ij.}\}$ because of independence

$$= \sum\sum c_{ij}^2 \frac{\sigma^2}{n} = \frac{\sigma^2}{n}\sum\sum c_{ij}^2$$

$$(\alpha\beta)_{ij} = A + B\alpha_i + C\beta_j + D\alpha_i\beta_j + E\alpha_i^2 + F\beta_j^2 \tag{1}$$

Averaging (1) over i yields:

$$(\overline{\alpha\beta})_{.j} = A + C\beta_j + E\sum\alpha_i^2/a + F\beta_j^2 = 0 \tag{2}$$

because $\sum\alpha_i = 0$ and $\sum\limits_i(\alpha\beta)_{ij} = 0$. Similarly:

$$(\overline{\alpha\beta})_{i.} = A + B\alpha_i + E\alpha_i^2 + F\sum\beta_j^2/b \tag{3}$$

because $\sum\beta_j = 0$ and $\sum\limits_j(\alpha\beta)_{ij} = 0$. From (2) and (3) we obtain:

$$C\beta_j + F\beta_j^2 = -A - E\sum\alpha_i^2/a \tag{4}$$

$$B\alpha_i + E\alpha_i^2 = -A - F\sum\beta_j^2/b \tag{5}$$

Substituting (4) and (5) in (1) yields:

$$(\alpha\beta)_{ij} = -A - E\sum\alpha_i^2/a - F\sum\beta_j^2/b + D\alpha_i\beta_j \tag{6}$$

Averaging (6) over j yields:

$$(\overline{\alpha\beta})_{i.} = -A - E\sum\alpha_i^2/a - F\sum\beta_j^2/b = 0 \tag{7}$$

Using (7) in (6) yields:

$$(\alpha\beta)_{ij} = D\alpha_i\beta_j \tag{8}$$

$$\log_e L = -3 \log_e 2\pi - 3 \log_e \sigma^2 - \frac{1}{2\sigma^2} \sum\sum(Y_{ij} - \mu_{..} - \rho_i - \tau_j)^2$$

$$\frac{\partial(\log_e L)}{\partial\mu_{..}} = -\frac{2}{2\sigma^2} \sum\sum(Y_{ij} - \mu_{..} - \rho_i - \tau_j)(-1)$$

$$\frac{\partial(\log_e L)}{\partial\rho_i} = -\frac{2}{2\sigma^2} \sum_j(Y_{ij} - \mu_{..} - \rho_i - \tau_j)(-1)$$

$$\frac{\partial(\log_e L)}{\partial\tau_j} = -\frac{2}{2\sigma^2} \sum_i(Y_{ij} - \mu_{..} - \rho_i - \tau_j)(-1)$$

Setting each partial derivative equal to zero, utilizing the constraints $\sum \rho_i = \sum \tau_j = 0$, simplifying, and substituting the maximum likelihood estimators yields:

$$\sum\sum Y_{ij} = \sum\sum \hat{\mu}_{..} \quad \text{or} \quad \bar{Y}_{..} = \hat{\mu}_{..}$$

$$\sum_j Y_{ij} = \sum_j(\hat{\mu}_{..} + \hat{\rho}_i) \quad \text{or} \quad \bar{Y}_{i.} - \hat{\mu}_{..} = \hat{\rho}_i$$

$$\sum_i Y_{ij} = \sum_i(\hat{\mu}_{..} + \hat{\tau}_j) \quad \text{or} \quad \bar{Y}_{.j} - \hat{\mu}_{..} = \hat{\tau}_j$$

21.22. $$E\{MSTR\} = E\left\{\frac{n_b \sum(\bar{Y}_{.j} - \bar{Y}_{..})^2}{r-1}\right\}$$

$$= \frac{n_b}{r-1} E\{\sum(\bar{Y}_{.j} - \bar{Y}_{..})^2\}$$

Since:

$$(\bar{Y}_{.j} - \bar{Y}_{..}) = (\mu_{..} + \tau_j + \bar{\epsilon}_{.j}) - (\mu_{..} + \bar{\epsilon}_{..}) = \tau_j + (\bar{\epsilon}_{.j} - \bar{\epsilon}_{..})$$

and:

$$\sum(\bar{Y}_{.j} - \bar{Y}_{..})^2 = \sum \tau_j^2 + \sum(\bar{\epsilon}_{.j} - \bar{\epsilon}_{..})^2 + 2\sum \tau_j(\bar{\epsilon}_{.j} - \bar{\epsilon}_{..})$$

we find:

$$E\{\sum \tau_j^2\} = \sum \tau_j^2$$

$$E\left\{\sum(\bar{\epsilon}_{.j} - \bar{\epsilon}_{..})^2\right\} = (r-1)\left(\frac{\sigma^2}{n_b}\right)$$

$$E\left\{2\sum \tau_j(\bar{\epsilon}_{.j} - \bar{\epsilon}_{..})\right\} = 0$$

Hence:

$$E\{MSTR\} = \frac{n_b}{r-1}\left[\sum \tau_j^2 + \frac{r-1}{n_b}\sigma^2\right] = \frac{n_b}{r-1}\sum \tau_j^2 + \sigma^2$$

21.23. From (A.69):

$$(t^*)^2 = \left[\frac{\bar{W}}{s\{\bar{W}\}}\right]^2 = \frac{n_b(n_b-1)(\bar{Y}_{.1}-\bar{Y}_{.2})^2}{\Sigma[(Y_{i1}-Y_{i2})-(\bar{Y}_{.1}-\bar{Y}_{.2})]^2}$$

From (27.6b):

$$MSTR = n_b\left(\left[\bar{Y}_{.1}-\left(\frac{\bar{Y}_{.1}+\bar{Y}_{.2}}{2}\right)\right]^2+\left[\bar{Y}_{.2}-\left(\frac{\bar{Y}_{.1}+\bar{Y}_{.2}}{2}\right)\right]^2\right)$$

$$= \frac{n_b}{2}(\bar{Y}_{.1}-\bar{Y}_{.2})^2$$

From (27.6c):

$$MSBL.TR = \frac{\sum_i\left[\left(Y_{i1}-\bar{Y}_{i.}-\bar{Y}_{.1}+\bar{Y}_{..}\right)^2+(Y_{i2}-\bar{Y}_{i.}-\bar{Y}_{.2}+\bar{Y}_{..})^2\right]}{(n_b-1)(2-1)}$$

Using:

$$\bar{Y}_{i.} = \frac{Y_{i1}+Y_{i2}}{2} \qquad \bar{Y}_{..} = \frac{\bar{Y}_{.1}+\bar{Y}_{.2}}{2}$$

we obtain:

$$MSBL.TR = \frac{1}{n_b-1}\sum_i\frac{1}{4}\left[(Y_{i1}-Y_{i2}-\bar{Y}_{.1}+\bar{Y}_{.2})^2+(Y_{i2}-Y_{i1}-\bar{Y}_{.2}+\bar{Y}_{.1})^2\right]$$

$$= \frac{1}{2(n_b-1)}\sum_i\left[(Y_{i1}-Y_{i2})-(\bar{Y}_{.1}-\bar{Y}_{.2})\right]^2$$

Therefore:

$$F^* = \frac{n_b(n_b-1)(\bar{Y}_{.1}-\bar{Y}_{.2})^2}{\Sigma[(Y_{i1}-Y_{i2})-(\bar{Y}_{.1}-\bar{Y}_{.2})]^2} = (t^*)^2$$

21.24. When there are no ties:

$$R_{..}^2 = [n_b r(r+1)/2]^2 \qquad \sum R_{i.}^2 = n_b\left[\frac{r(r+1)}{2}\right]^2$$

$$\sum\sum R_{ij}^2 = n_b[r(r+1)(2r+1)/6]$$

Then:

$$\frac{n_b(r-1)SSTR}{SSTR+SSBL.TR}$$

$$= \frac{(r-1)\left(\Sigma R_{.j}^2-\frac{R_{..}^2}{r}\right)}{\left(\frac{\Sigma R_{.j}^2}{n_b}-\frac{R_{..}^2}{rn_b}\right)+\left(\Sigma\Sigma R_{ij}^2-\frac{\Sigma R_{i.}^2}{r}-\frac{\Sigma R_{.j}^2}{n_b}+\frac{R_{..}^2}{rn_b}\right)}$$

$$= \frac{(r-1)\left(\sum R_{.j}^2-\frac{R_{..}^2}{r}\right)}{\sum\sum R_{ij}^2-\frac{\Sigma R_{i.}^2}{r}}$$

$$= (r-1)\left[\sum R_{.j}^2-\frac{n_b^2(r+1)^2 r}{4}\right]\div\left[\frac{n_b r(r+1)(2r+1)}{6}-\frac{n_b r(r+1)^2}{4}\right]$$

22.23. $Y_{ij} = \mu_{.} + \tau_i + \gamma(X_{ij} - \bar{X}_{..}) + \epsilon_{ij} = \Delta_i + \gamma(X_{ij} - \bar{X}_{..}) + \epsilon_{ij}$

$Q = \sum\sum[Y_{ij} - \Delta_i - \gamma(X_{ij} - \bar{X}_{..})]^2$

$$\frac{\partial Q}{\partial \Delta_i} = 2\sum_j [Y_{ij} - \Delta_i - \gamma(X_{ij} - \bar{X}_{..})](-1)$$

$$\frac{\partial Q}{\partial \gamma} = 2\sum\sum[Y_{ij} - \Delta_i - \gamma(X_{ij} - \bar{X}_{..})][-(X_{ij} - \bar{X}_{..})]$$

Setting the partial derivatives equal to zero, simplifying, and substituting the least squares estimators yields:

$$\sum_j Y_{ij} - \hat{\gamma}\sum_j (X_{ij} - \bar{X}_{..}) = n_i\hat{\Delta}_i$$

or:

$$\hat{\Delta}_i = \bar{Y}_{i.} - \hat{\gamma}(\bar{X}_{i.} - \bar{X}_{..})$$

and:

$$\sum\sum[Y_{ij} - \hat{\Delta}_i - \hat{\gamma}(X_{ij} - \bar{X}_{..})](X_{ij} - \bar{X}_{..}) = 0$$

or:

$$\sum\sum Y_{ij}(X_{ij} - \bar{X}_{..}) - \sum\sum[\bar{Y}_{i.} - \hat{\gamma}(\bar{X}_{i.} - \bar{X}_{..})](X_{ij} - \bar{X}_{..}) = \hat{\gamma}\sum\sum(X_{ij} - \bar{X}_{..})^2$$

$$\hat{\gamma} = \frac{\sum\sum(Y_{ij} - \bar{Y}_{i.})(X_{ij} - \bar{X}_{i.})}{\sum\sum(X_{ij} - \bar{X}_{i.})^2}$$

It needs to be recognized in the development that:

28.4. For $r = 7, r_b = 5$, a BIBD exists for $n_b = \dfrac{7!}{5!(7-5)!} = 21$.

Since $n_b r_b = nr$, $n = 21(5)/7 = 15$.

Since $n_p(r-1) = n(r_b - 1)$, $n_p = 15(5-1)/(7-1) = 10$.

28.5. For $r = 8, r_b = 3$, a BIBD exists for $n_b = \dfrac{8!}{3!(8-3)!} = 56$.

Since $n_b r_b = nr$, $n = 56(3)/8 = 21$.

Since $n_p(r-1) = n(r_b - 1)$, $n_p = 21(3-1)/(8-1) = 6$.

28.10. $r = 4$, and $r_b = 3$, $df_e = 4n - 4 - 4n/3 + 1 = 8n/3 - 3$.

Since $n_p = n(3-1)/(4-1) = 2n/3$, $\sigma^2\{\hat{D}_j\} = 2\sigma^2(3)/(4n_p) = 9\sigma^2/(4n)$

$$T\sigma\{\hat{D}_j\} = \frac{1}{\sqrt{2}} q[.95; 4, 8n/3 - 3] \sqrt{\frac{9\sigma^2}{4n}}$$

For $\sigma^2 = 2.0$ and $T\sigma\{\hat{D}_j\} \leq 1.5$, so we need to iterate to find n so that

$$n \geq q^2[.95; 4, 8n/3 - 3]$$

We iteratively find $n \geq 15$. Since design 2 in Table 28.1 has $n = 3$, we require that design 2 be repeated 5 times. Thus, $n = 15$, and $n_b = 20$.
